A special solution based on Microsoft Dynamics CRM 4.0

The Stunnware Tools for Microsoft Dynamics CRM 4.0 combines a set of tools created for CRM developers and consultants. Initially being divided into multiple standalone applications, the tools framework serves as a single container for all of them, allowing for interaction between components which wasn't possible before:

- The general purpose of the Metadata Viewer is to get a quick overview of entities, attributes, relationships and everything else contained in the CRM Metadata.
- The Excel Export is a small utility allowing to export data being displayed in views into the Excel 2003 XML format.
- The FetchXml Wizard is a graphical query editor based on the FetchXml query language. Like a designer in Visual Studio, you can create a query either in a designer window or in a code window. You can also execute queries, look at the result XML, create and run .NET code based on your query, investigate the SOAP messages and build appropriate JavaScript code for CRM forms.
- The Code Generator creates C# and VB classes for all or selected entities, providing nullable properties for easy access. All attribute names in each class are defined as constant strings, so you never have to look at CRM again to remember the correct spelling. It creates enumerations for all picklists, state and status attributes and adds methods for easy use of the CRUD operations (Create, Retrieve, RetrieveMultiple, Update, Delete) and to change an entity's state. It also provides easy management of all reference types (Lookup, Owner, Customer), adds comments to classes, properties and methods, which are available in Visual Studio through Intellisense. Furthermore it allows you to create your own code generation templates. If you want some special methods in every class, then simply add it to the template files.
- The Documentation module is meant as a tool to create technical documentations of a CRM organization. It uses the Microsoft HTML Help Compiler to create a compiled HTML file (chm extension) that you can deliver to customers or use it for your own reference.
- Though there is a complex example shipped with the product, you are totally free in defining the content and look and feel.
- The Customization Comparer takes two CRM customization export files (customization.xml) and compares their contents. All modifications are shown in a result tree, giving a quick view of what has changed. All you have to do is exporting all customizations and save the file for later reference. You can then, at any time, do an export again and compare these files.
- The Trace File Viewer allows easy parsing of CRM trace files and offers a variety of filtering options.
- The ISV Config and Sitemap editors allow editing the CRM configuration files on the fly.
